

Webl: Filter a Query on Results from Another Query (Query on Query)

Purpose

This procedure describes how to filter a query on values returned from an object in another query in BusinessObjects WebI. For example, you could filter a query in SA03 (Student Records) on values of Emplid in a query on SA02 (Recruiting and Admissions).

Edit Query

- 1. Create the first query and run it.
- **Note:** The first query has to be run or saved before you can filter on its results in the second query.

- 7. Drag the object into the **Query Filters** pane on which you want to filter, based on the results of Query 1.
- 8. Select the operator
- 9. Select **Result from another query** from the operands drop-down list.
- Note: Depending on which operator you selected, you may have the option to select Result from another query (Any) or (All). For more information, see <u>Webl: Query-on-Query</u>.

- 10. Select the appropriate object in Query 1.
- 11. Click **OK**.
